## Editorial Board

2011-2015

The World Journal of Medical Genetics Editorial Board consists of 103 members, representing a team of worldwide experts in medical genetics. They are from 28 countries, including Australia (2), Belgium (1), Canada (2), Chile (1), China (13), Croatia (1), Czech Republic (1), Ecuador (1), France (3), Germany (2), India (3), Iran (3), Israel (1), Italy (7), Japan (4), Malaysia (1), Netherlands (3), Peru (1), Russia (1), Saudi Arabia (2), Singapore (1), South Korea (3), Spain (4), Switzerland (1), Turkey (5), Ukraine (1), United States (34), and Uruguay (1).

**ABOUT COVER** *World Journal of Medical Genetics* Editorial Board, Steven R Lindheim, MD, MMM, Professor, Department of Obstetrics and Gynecology, Division of Reproductive Endocrinology and Infertility, Center for Reproductive Health, University of Cincinnati College of Medicine, 2123 Auburn Avenue, Suite A-44, Cincinnati, OH 45219, United States

**AIM AND SCOPE** *World Journal of Medical Genetics (World J Med Genet, WJMG, online ISSN 2220-3184, DOI: 10.5496)* is a bimonthly peer-reviewed, online, open-access, journal supported by an editorial board consisting of 103 experts in medical genetics from 28 countries.

The *WJMG* aims to rapidly report the most recent results in medical diagnostics, therapeutic techniques and equipment, clinical medical research, clinical and experimental techniques and methodology. Its purpose is to provide a platform to facilitate the integration of clinical and laboratory disciplines to highlight genotype-phenotype associations at a qualitative high level, which will help to improve diagnostic accuracy and medical care, and in the longer run, therapeutic intervention. The journal publishes original articles and reviews on the following topics: (1) Laboratory research, including but not limited to techniques in DNA/RNA sequencing, whole-genome linkage analyses and association studies, copy number variation profiling, epigenetic modifications in health and disease, elucidation of molecular and cellular pathways affected by gene mutations, determination of transcription factor binding sites, protein-protein interactions, preparation and transformation of induced pluripotent stem cells, animal models of human hereditary disorders and bioinformatics; and (2) Clinical genetics research on etiology, epidemiology, pathogenesis, morphology and function, signs and symptoms.

### Abstract

There continues to be an increase in utilization of assisted reproductive technology (ART), including the use of third party gametes. Specifically, the use of third party oocytes, most recently reported in 2010 by the United States (US) Center for Disease Control and Society of Reproductive Medicine, accounted for 15 504 cycles and 7334 live births. This translates into approximately 11% of all the *in vitro* fertilization cases performed in the US. As utilization increases and the technological tools advance, they have created underappreciated and unforeseen ethical quandaries. As such, many practitioners think they "have heard it all". However, each ART scenario is novel with the potential to pose complex unforeseen issues, potentially creating global challenges that could impact broad social and legal questions and test the moral consciousness of practitioners, policymakers and patients. While there are published US national guidelines to assist practitioners, we have identified new complex issues in assisted reproduction that present unique challenges, and we give a perspective from our

eyes in the Western Hemisphere looking out to a global level. Specifically, this review focuses on some of the more recent and evolving issues that currently are and will be confronting us in the upcoming years. Particular attention focuses on discrepancies between third party legal contracts and ART consents regarding level of information sharing, and oocyte and embryo directives and management; dilemmas and obligations surrounding disclosure of medical outcomes especially in the context of growing access to Direct to Consumer genetic testing and Reproductive Tourism-Exile. Given the complexity of these and other ethical questions, finding answers may be achieved by ending the isolation of reproductive professionals and instead promoting increased and consistent communication among physicians, embryologists, therapists and reproductive attorneys to confront these evolving ethical quandaries.

### INTRODUCTION

The advent of assisted reproductive technology (ART), almost a century ago, came about through the clandestine use of donated sperm<sup>[1]</sup>. The use of donated oocytes, only first described in 1983, was used to establish pregnancy in a patient with primary ovarian failure<sup>[2,3]</sup>. Today,

the use of donated oocytes and embryos has increasingly become routine for *in vitro* fertilization (IVF) clinics accounting for almost 11% of all IVF cycles reported in the Society for Assisted Reproductive Technology and Centers for Disease Control and Prevention ART/CDC registry<sup>[4]</sup>. Through the landmark efforts of the groups at Monash University and the University of California, Los Angeles, this technology has resulted in more than 50 000 births in the United States (US) alone<sup>[5,6]</sup>.

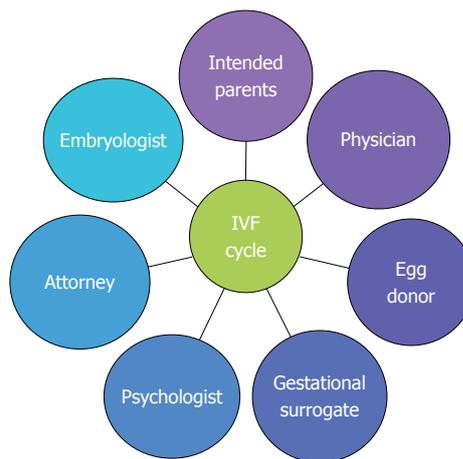

The use of 3rd party reproduction, including donors and surrogates, has gained increasing acceptance among patients, and now plays a major role in treating intractable problems related to oocyte function. In 1992, oocyte donation was successfully extended to women over the age of 50, revealing that women of any age could theoretically become pregnant, though collectively creating public debate about the limits on the use of the technology and whether IVF clinics should set age limits for their patients<sup>[7]</sup>. While some of the sensationalism has subsided, today, most feel that human oocyte and embryo donation is ethically and socially acceptable<sup>[8]</sup>.

As such, the increased utilization of oocyte and embryo donation continues to present us with ethical quandaries that impact broad social and legal questions. This review focuses on some of the more recent and evolving issues that currently are and will be confronting us in the upcoming years. Given the complexity of ethical questions, finding answers to the questions may be achieved by ending the isolation of reproductive professionals and instead promoting increased and consistent communication and case consult among physicians, embryologists, therapists and attorneys (Figure 1).

## REMOVING THE BARRIERS TO COMMUNICATION: CLOSING THE CIRCLE AROUND REPRODUCTIVE HEALTH PROFESSIONALS

The American Society for Reproductive Medicine (ASRM) guidelines have established extensive recommendations for screening and testing oocyte donor candidates<sup>[9]</sup>. As part of the screening process, donors undergo medical evaluations, sexually transmitted disease and genetic screening. The donor consenting process needs to include a comprehensive discussion of medical risks and psychological issues. The psychological assessment should evaluate for evidence of coercion (financial or emotional) and is intended to ensure that the donor is made aware of all relevant aspects of medical treatments, including the ability to comply with the rigorous schedule and discomforts of injectable drugs. The ASRM also states that candidates should be informed of all aspects of potential oocyte and embryo management as well as final disposition applicable to each practice. The psychological evaluation serves to identify potential ambivalence that may be resolved prior to undergoing an oocyte donation cycle.

It has been recommended that donors and recipients

**Figure 1** Coordinated efforts among multiple reproductive health professionals.

have separate legal counsel, as legal agreements have increasingly become a central component of the process and are required in some states<sup>[10]</sup>. Legal agreements are used to describe and memorialize the expectations, duties and responsibilities of both the donor and recipient. A consultation informs participants of their legal rights and addresses parentage presumptions. The legal consult should include implications of options and decisions, and should be initiated early in the evaluation and screening process to ensure that the donor and the recipient's expectations are allied. The object of involving the legal team earlier in the process is to reduce the surprises at the end once a clinic has "approved" the donor, and suddenly the parties realize that they have fundamentally different expectations regarding a major aspect of their relationship.

Agencies and ART clinics, however, are not bound by ASRM guidelines, and clinics develop their own processes as evidenced by the variation among donor-recipient experiences. Communication, disclosure, amount of information gathered and shared, written agreement requirements and degree of involvement of attorneys are highly variable among agency and clinic practices. All too often, psychological recommendations fail to include a discussion of the donor's wishes about future use of embryos or wishes about future contact (personal experience: Lindheim SR and Jaeger AS). Many times agencies and clinics refuse to release psychological evaluations to attorneys, despite HIPAA and other documented consent allowing the release of information to them, which stonewalls the legal process and requires yet another discussion of the donor's wishes (personal experience: Jaeger AS). This variability makes the process potentially even more overwhelming and anxiety-provoking for intended parents.

While ASRM recommends legal involvement, they do not specify when in the process this should be initiated. Practically speaking, oocyte donation cycles should only be commenced once all medical screening and testing is completed, as well as completion of consents and the

legal discussion and agreements finalized. Often the legal agreement, however, is not initiated or completed until the donor is set to initiate her medications. Two clinical situations serve as a point. First, a couple who had successfully undergone an oocyte donation cycle, re-contacted the Program to donate their remaining cryopreserved embryos to the Embryo Donation Program. Upon review of their executed legal agreements, the donor had declined this option in her donor legal agreement, yet the donation was concordant with the donor's stated desires to the medical-clinical team and her executed consent to treatment. In the second scenario, at the request of the recipient couple, the ART Program contacted the donor to change her disclosure preferences in contravention to her previously signed donor-recipient agreement to decline any future information sharing with her intended recipients. The ART program threatened to withdraw their approval of her participation if she did not agree to this change. In addition to unilaterally persuading the donor to violate the terms of the agreement, the ART Program also violated the donor's right to counsel and disrupted the attorney-client relationship, since the attorney for the donor was not notified of the unilateral change. The clinic undermined the donor's entire understanding of the relationship and created distrust among the parties.

A recent report suggested that more than 60% of donor-recipient legal contracts are discrepant from their consents regarding level of information sharing and oocyte and embryo directives and management<sup>[11]</sup>. This suggests that donors often reconsider several aspects of their decision to donate during the time elapsed between their consents and final legal agreements. Several possibilities for this discrepancy can be suggested. A donor may feel (1) deliberate reflection and change regarding her donation; (2) impulsiveness to speed the process where financial incentives may accentuate this feeling; (3) coercive effects from medical professionals, donor agencies, or reproductive attorneys; or (4) confusion.

There is data to suggest that oocyte donors often reconsider several aspects of their decisions during the time elapsed between initial discussions, consenting and their actual egg donation. Researchers have noted that, as donors become more knowledgeable and experienced with the donation process, they may become more comfortable and more willing to assert their opinions and their attitudes may change over time<sup>[12,13]</sup>. On the other hand, the escalation of payment suggests that money has become a dominant factor and a highly motivating interest. The "new age" donor appears less interested in the needs of the couple than her own employment by the ART program/agency. Many professionals both inside and outside the field of assisted reproduction have concerns regarding the seductive nature of financial incentives, whereby oocyte donors may be unable to adequately weigh the risks of ovarian hyperstimulation, oocyte retrieval and issues relevant to future information sharing and oocyte-embryo management and disposition. With the growing demand for oocyte donors, the pres-

sure to complete these cycles by both recipient couples and donor agencies, who more often have donors already matched for future cycles, puts enormous pressure on programs to speed the process and fulfill the presumed needs of oocyte donors and recipient couples.

Since post-donation satisfaction is negatively correlated with pre-donation financial motivation and pre-donation ambivalence, it is essential to understand and support the impact of changes in donor preferences to further improve all parties' satisfaction<sup>[14,15]</sup>. While ART programs have limited resources including staff and professional personnel to address these issues, today more than ever, those participating in gamete donation have an ethical obligation and a legal duty to understand, respect, and counsel all involved parties' disclosure desires through comprehensive informed consent and counseling processes. Egg Donor programs, both in-house and agencies, should establish policies regarding disclosures and re-contact procedures.

This calls for a collaborative process among all reproductive health professionals who interface with both the intended recipients and oocyte donor. Programs should work closely and cooperatively with donor agencies and reproductive attorneys who prepare donor-recipient agreements so that contract provisions match the desires and wishes of both parties. A concerted effort to uncover and communicate such changes is essential for all professionals involved to distinguish among deliberate reflection, impulsiveness, duress, need for clarity or to reduce confusion in order to maximize third party participants' (donors and recipients) positive experiences. Collaborative efforts that have been employed include consented release to their attorney information regarding level of future information sharing and oocyte directives and management. Inclusive flow of information and communication among reproductive health professionals supports the notion that "Closing the Circle" will help overcome obstacles and avoid potentially significant legal battles.

---

## DILEMMAS AND OBLIGATIONS SURROUNDING DISCLOSURE OF MEDICAL OUTCOMES

---

ASRM has published guidelines which state all prospective donors should be in good health and should not have any major mendelian disorders, major malformations or genetic disorders or any significant familial disease with a major genetic component or life-threatening disorders<sup>[16]</sup>. Ultimately, ASRM recommends that clinical outcomes for each treatment cycle should be recorded and permanent records about each donor be maintained to serve as a future medical resource for any offspring produced. The storage of this information is relevant to the recipients as it relates to other information-sharing decisions they may make<sup>[17]</sup>. In addition, IVF programs, egg donor agencies and sperm banks should honor the original disclosure pa-

parameters described in the agreement between the donor and recipients unless the donor and recipients mutually agree to disclose more (or less) than originally agreed upon or the donor and adult child agree to additional disclosure<sup>[18]</sup>. If a party, however, has initially refused future contact after a full discussion with medical, psychological and legal professionals, then legally and ethically she or he should not be contacted to reconsider the decision. Recontact is ethically complicated if the clinic or agency failed to provide adequate time for and access to legal and psychological counseling when the party made the future contact decision.

Issues surrounding informed consent within egg donation programs have recently been spotlighted in the clinical genetics branch of medicine. As advances in molecular genetics continue to evolve including the use of comparative genomic hybridization microarrays and other genomic technology such as high-density single nucleotide polymorphism genotyping microarrays, researchers and clinicians will be able to further identify individuals who are genetically susceptible or at an increased risk for a particular disease<sup>[19]</sup>. In some cases, obstetrical outcome may ultimately reveal a medical condition in a live-born that is attributed to the donor. Further genetic testing may be required and could have consequences including (1) re-contacting the donor at a later date for tissue typing; (2) request for organ donation or bone marrow transplant; and (3) disclosure and involvement to family members beyond the individual donor and theoretically, making accurate assessment only possible if multiple members of the donor's family participate in testing<sup>[20,21]</sup>. Furthermore, advances in molecular genetics can lead to the molecular diagnosis and recognition of many genetic conditions from stored blood samples of gamete donors, heel sticks obtained through newborn screening programs and cord blood samples from the offspring. This may allow researchers and clinicians to recognize genetic profiles that may identify certain treatable or preventable diseases in gamete donors and their offspring. This has significant implications for the donor's reproductive choices, health concerns for her children (if she has any) and even has financial considerations impacting the donor's ability to secure health insurance or other medical treatments. The development of these new testing techniques, as well as the advancement of reproductive medicine, has progressed so swiftly that clinical and legal policies have struggled to integrate the informed consent, future re-contact, and legal, ethical and psychological aspects of the testing modalities.

Overall, it is generally agreed upon in the medical and research community that any pre-treatment assessment and testing results should be given to its research participants<sup>[22-24]</sup>. The American National Heart, Lung and Blood Institute task group recently recommended reporting results to study participants when (1) the associated risk for the disease is significant; (2) the disease has important health implications to the participants; (3) proven therapeutic or preventive measures are available;

and (4) the establishment of laboratory validity has been performed<sup>[25]</sup>.

Similar to the American National Heart, Lung and Blood Institute, ASRM endorses full disclosure when genetic information or medical information comes to light resulting from their donation or in offspring that may affect their health or the health of their own family, though only upon request. As such, while ASRM endorses outcome disclosure, they acknowledge that disclosure of any genetic testing is based on each clinic's policy of appraisal including unexpected information and that it is ethically acceptable for programs not to inform donors of cycle outcomes as it may violate recipients' privacy rights if disclosed involuntarily. This presents a unique challenge, as these recommendations for full disclosure typically are not addressed by programs because they fail to take into account the individual preferences of gamete donors and recipients, where both more often express a desire for anonymity and non-disclosure, including no future re-contact regarding the use of 3rd party gametes<sup>[26]</sup>. It has also come to light that legal obligations created in the donor-recipient agreement may have disclosure and re-contact provisions that more often are dramatically different from either the agency or sperm bank commitment or the IVF clinic's informed consent to treatment document (personal experience of the authors). Sometimes people participate in independent donor registries, in contravention to previous agreements. Rarely are clinics or storage facilities informed of these changes.

Several studies have assessed research participant's desire to know study results. A survey of donor preferences in a Japanese population-based genetic epidemiologic cohort study ( $n = 1857$ ) revealed that while the majority of donors wished to be re-contacted and receive disclosure of information, 13% of respondents (15% female and 10% males) did not want to be re-contacted<sup>[27]</sup>. A Swedish study surveyed general attitudes toward tissue donation for a hypothetical bio-bank study where collection of blood and tissue samples had been collected, and approximately 10% of subjects did not want to know if they had any genetic pre-disposition to disease under any circumstance, while merely 55% only desired the results if an effective treatment or prevention was available<sup>[28]</sup>. Other studies consistently reveal that a proportion of subjects do not want disclosure of genetic testing. Vernon *et al*<sup>[29]</sup> revealed 10% of patients with hereditary nonpolypoid colorectal cancer who had given blood samples did not want to know the results of the genetic testing and data from the Puget Sound Surveillance Epidemiology and End Results registry also suggested some colorectal cancer patients and their relatives were not interested in identifying and discussing their genetic status<sup>[30]</sup>.

With respect to third party reproduction, only recently, Lindheim *et al*<sup>[11]</sup> reported views from both oocyte recipients and donors. Oocyte recipients generally were amenable to disclosure to their oocyte donor of pregnancy outcome (88%), contact for a medical emergency (74%), and disclosure of medical or genetic condition

to oocyte donors (88%), which was consistent over time from the ante-to post-partum periods. In contrast, at their initial interview, oocyte donors were also generally amenable to contact for a medical emergency (83%), and disclosure of a medical or genetic outcome (83%), however, they were reticent to obtain the knowledge of pregnancy outcomes (31%). For those oocyte donors who underwent the whole process including oocyte retrieval, there was a more general reticence to receiving information regarding a medical or genetic condition (93% *vs* 38%)<sup>[11]</sup>.

For those who do not want disclosure or future contact, this raises ethical issues often seen in genetics and medicine which not only include issues related to the duty and obligation to re-contact and disclose the inadvertent or unanticipated results, but also weighing against the recipient and donor's unique individual preferences and contractual obligations for disclosure. Some have argued that the possibility of knowing unanticipated testing results and adverse outcomes raises the responsibility to further explore and understand the reticence of research candidates (and in this case donors and recipients) to disclose or become informed. It is also important to appreciate that attitudes including level of comfort and disclosure towards assisted reproduction are likely to change over time, and this should be acknowledged to patients at the onset of the process.

With respect to re-contact, the International Ethics Committee of the Human Genome Project strongly suggests that research participants' right not to know genetic results must be secured prior to the study<sup>[31]</sup>. Again, the issue of re-contacting donors could be harmful because this may be considered an invasion of privacy as well as a breach of contract had she not previously agreed to be "re-contacted". This creates a conundrum because the donor might have changed her mind about receiving the information, however, she cannot consider whether or not she has changed her desire to know because to re-contact her to inquire would be a legal and ethical violation of her earlier consent.

Further complicating the picture is that the future holds the real potential for consumers to have access to Direct to Consumer (DTC) genetic testing, including oocyte recipients who may obtain archival DNA from an oocyte donor-conceived child and have it tested by a private company, outside of any legal, psychological or medical safeguards or prior commitments not to conduct such testing. It has become increasingly challenging, if not impossible, to inform a patient of all potential genetic information that could be acquired and the consequences of that information, yet DTC possibilities should be disclosed to the donor. Paramount to this information is the accuracy of such testing and correct interpretation of test results, and the meaning of the information to the affected person. The risk is magnified as there is an increasing number of DTC and over-the-counter testing combined with greater consumer acceptance of such genetic testing. As recipients are informed about the ability

to store DNA samples from the donor for future testing or even store cord blood for future testing, the complexity of gathering, testing, validating, disclosing and explaining such information is compounded. Many regulators, including the States of California and New York, have called for additional oversight and ethical guidelines for DTC testing<sup>[32,33]</sup>. Furthermore, the legal and communication needs, including informed consent and legal agreements for all involved parties documenting each party's commitment to each other, demand a broader and more integrated approach.

The future is here, where a well thought out procedure and protocol is needed at the ART program level to ascertain and secure the individual preferences of gamete donors and recipients for future re-contact at the onset of any gamete donation cycle. This should include the involvement of a mental health professional and a genetic counselor or geneticist to assist in the policy development of the informed consent procedure since they possess a knowledge base of patient concerns and anxieties<sup>[34,36]</sup>. Moreover, it should include the involvement of reproductive attorneys to assist with policy development and implementation. Implicit in this protocol is informed consent, which involves more than simply signing a form of authorization for a procedure in order to protect providers from legal risks. Informed consent must include provisions for the future identification of tests, results and outcomes, prior to any research or outcomes regarding the right to disclose genetic results, which needs to be clearly identified to truly respect a patient's future autonomy<sup>[37,38]</sup>.

Understanding the preferences regarding contact and disclosure for both donors and recipients impacts ART Programs' recruitment, screening and consent practices, legal agreements between donors and donor agencies and between donors and recipients, and policies for ART Programs. Oocyte donor programs, both in-house and agencies, should establish policies regarding disclosures and re-contact procedures. It underscores the delicate balance between parental interests and desires in creating their family and anticipated interests of future children including curiosity to know their genetic heritage.

## REPRODUCTIVE TOURISM-EXILE

Increasingly, couples are traveling from their country of residence to another in order to receive specific reproductive treatments not allowed, not available, or too costly in their own country<sup>[39]</sup>. This practice has been coined "reproductive tourism", though others have argued that this term is both inaccurate and inappropriate, as it suggests that couples are traveling for pleasure and alternatively have suggested the term "reproductive exile"<sup>[40]</sup>. In contrast, couples and individuals in the United States travel to other countries to take advantage of significantly reduced costs of egg donors and gestational carriers. Many times, the initial benefit of reduced compensation is offset by higher legal costs and anxiety when parentage

orders and passports are denied by the foreign country.

The main reasons for reproductive tourism-exile have been eloquently summarized including: (1) treatment that is prohibited in the country of origin because the application is considered ethically unacceptable (use of donor gametes or sex selection for non-medical reasons); (2) patients possess characteristics that are considered to make them unfit for parenthood (postmenopausal intended mother, advanced age of the couple, unmarried, or same sex couple); (3) the technique is considered medically unsafe (oocyte freezing, cytoplasmic transfer); (4) treatment is not available because of lack of expertise (preimplantation genetic diagnosis); (5) the waiting lists are too long (donor oocytes); or (6) costs (fees) are exorbitantly high<sup>[39]</sup>.

Since the infamous case of Diana Blood, who transferred the sperm of her deceased husband from the United Kingdom to Belgium in order to be inseminated, most instances of reproductive tourism-exile are performed for women who require donor oocyte or donor sperm. At the time Belgium had no laws on assisted reproduction, the Belgian register on assisted reproduction for 1999 indicated that 30% of patients receiving IVF and 60% of all oocyte donor recipients were foreigners<sup>[41]</sup>. Belgium has since changed its laws<sup>[42]</sup>. French patients cross the border because they want to increase their chances of success by avoiding the obligatory embryo freezing after oocyte donation or because they do not want to comply with the “personalized anonymity” rule, which precludes the use of a known oocyte donor<sup>[43]</sup>. For preimplantation genetic diagnosis in Belgium, half of all couples are from Germany and France as a result of legal or practical restrictions in their countries or origin<sup>[44]</sup>. Spain attracts oocyte recipients from all over Europe because of the long waiting lists in other countries.

### **International gestational surrogacy**

International gestational surrogacy is an area of increasing concern. A surrogate’s services are used in the following situations: (1) Foreign Nationals as intended parents (IPs) using a US surrogate who delivers a child in the US; (2) US-IPs using a surrogate who resides and delivers in a foreign country; or (3) US-IPs using a non-US citizen surrogate who illegally resides and delivers in the US. Similar questions for each scenario that have been raised include: (1) Who will the law define as the legal parents? (2) Will the law protect the child’s welfare and best interests? (3) Which country’s laws apply to the surrogate arrangement and the finalization of parental rights?

In many cases, this has led to inconsistent and unfortunate outcomes where children have been defined as orphans or genetic parents’ rights were not recognized<sup>[45-48]</sup>. Each scenario discussed below has its own unique legal and ethical concerns.

### **US-IPs using a foreign gestational surrogate**

Ethical concerns regarding global fertility arrangements have focused on issues of exploitation. Very recently a

US attorney pleaded guilty to felony charges related to international surrogacy activities. She arranged to have non-US women pose as “surrogates”, and then once they were pregnant, matched them with US couples through deceit and misrepresentation to both the prospective parents and the courts. While women are being “employed” as surrogates, with global economic disparity, the question that arises is, “are women being coerced into being surrogates?” Fully informed consent with sufficient counseling and support can be a challenge for domestic surrogacy arrangements, however, adding a cross-cultural component and language differences further add to the risk that parties are inadequately informed and counseled about the process.

It is also ethically complicated to define what the parameters of coercion are. Some would argue, for example, that even if a foreign surrogate receives better medical care during her pregnancy than the typical pregnancy in her country, the process is still unethical because the care is less than what a US surrogate would receive. On the other hand, if surrogacy is the best opportunity to earn money for a foreign woman given her other employment options, is it wrong even though she is being paid a third of what a US surrogate would be paid? In other words, while payment appears to be inherently coercive and an offensive commodification, should women not be allowed to provide for themselves and their children in this way, especially if the alternative is worse?

Another significant issue is the protection of the foreign surrogate’s health and her human rights. Many concerns have been raised regarding the process of foreign surrogate screening. Other concerns surround relinquishment of the child and whether surrogates are given access to legal protection(s) and follow-up counsel if future concerns or issues arise regarding their surrogate arrangement.

Conversely, issues that raise concern for US-IPs include adequate disclosure regarding the health and pregnancy status of the foreign surrogate, which may in part be due to cultural and language barriers that may not satisfy the needs of the IPs. While in the US failure to disclose this information may provide a legal cause of action<sup>[49]</sup>, it may not be actionable in another country. In addition, US-IPs may also not be aware of another country’s statutes used to recognize or deny their parental rights. IP’s use of US adoption laws could be problematic if courts rely on the relinquishment statements of the surrogate provided only through affidavits instead of being present during court proceedings. With these complexities, each party must be adequately informed as US-IPs are more inclined to be short sighted, focusing on reduced medical costs and simply hoping to avoid potential expensive legal complications.

### **Foreign National-IPs using a US gestational surrogate**

While there are no residency requirements for finalization of parentage proceedings when a child is born in the US, navigation through the US legal system is critical for for-

eign nationals to finalize their parental rights and to deal with issues related to foreign or dual citizenship. Even if foreign nationals navigate the US legal system, it is not a guarantee that their country will accept a US court order determining parentage. Ensuring adequate health insurance coverage for the surrogate is necessary to not only complete medical-psychological assessment at the outset, but to ensure that the Foreign National-IPs pay for antepartum, postpartum and neonatal care if needed regardless of court petitions to determine parentage or custody. It can be difficult and costly to secure insurance coverage for the newborn(s), but it is not routinely secured as part of Foreign National-IP surrogate arrangements. This can result in exorbitant bills that the Foreign National IP may not feel obligated to pay, particularly in the treatment for premature infants. This places an enormous burden on the US health care system.

### **US-IPs using a foreign gestational surrogate who illegally resides and delivers in US**

Sometimes non-US citizens serve as surrogates to US-IPs including relatives or undocumented workers hired by IPs “under the radar” as a domestic or hourly laborer. This relationship may raise a number of quandaries. Generally the US-IPs provide room and board during the pregnancy. This has the potential for the surrogate to feel isolated and vulnerable as the constant scrutiny of the IPs can create a potentially abusive situation. The surrogate may not be able to effectively communicate to others including the obstetrician or seek protection for fear of deportation. The intended parents may have falsely offered citizenship, or the surrogate may be misinformed about the legal status of the baby and how it impacts her and her family.

For the intended parents, the surrogate is a flight risk where she could return to her country of origin making it extremely difficult to enforce the relinquishment of the child per the terms of the contract. The carrier may be uninsured, placing additional burdens on the health care system.

International issues of ART have forced courts to make decisions in the absence of laws, international treaties and even a global consensus about the appropriateness of the transnational fertility market. In contrast, international adoption law (The *Hague Convention on Intercountry Adoption*) has been ratified by many nations setting legal and ethical standards for adopting children around the world<sup>[50]</sup>.

Given the prevalence of reproductive tourism-exile, the ethical issues can best be addressed with international cooperation. Establishment of guidelines presumes that the international community can agree on shared values in protecting participants and promoting the health and welfare of children.

## **CONCLUSION**

These are but a few of the plethora of difficult questions

we are confronted with surrounding third party reproduction. This complex process requires consideration of broad social, ethical, and legal issues. Each potentially impacts prospective parents, their offspring, egg donors and gestational carriers, and society. The advances and increased utilization of this technology has and will continue to create additional legal and policy challenges not only in the US but abroad as well. Reproductive law responds to medical uses of technology and underscores the importance of a closed circle of communication connecting reproductive professionals. There is an ever-increasing need for clarity and consistency in the area of reproductive law and willingness of medical professionals to follow policy guidance from a broader community both domestically and internationally. Collaborative efforts between reproductive health professionals allows for a seamless dialogue between reproductive law and medicine, which in the end is essential to meet the needs of all involved parties, and most importantly the needs of children conceived through ART.

## Acknowledgments to reviewers of World Journal of Medical Genetics

We acknowledge our sincere thanks to our reviewers. Many reviewers have contributed their expertise and time to the peer review, a critical process to ensure the quality of our World Series Journals. Both the editors of the journals and authors of the manuscripts submitted to the journals are grateful to the following reviewers for reviewing the articles (either published or rejected) over the past period of time.

## Events Calendar 2012

January 19, 2012

2nd joint scientific meeting: Progress In Quality Assurance And Technical Developments In Genetic Testing  
Nijmegen, The Netherlands

January 20, 2012

Exploiting bacteriophages for bioscience, biotechnology and medicine  
Welwyn Garden City,  
United Kingdom

January 26, 2012

An Introduction to miRNA and siRNA  
The Nowgen Centre,  
Manchester, United Kingdom

February 2-4, 2012

6èmes Assises de Génétique Humaine et Médicale  
Marseille, France

February 2-5, 2012

International Congress on Personalized Medicine: Up Close and Personalized (UPCP 2012)  
Florence, Italy

February 16, 2012

The 2012 London Regenerative Medicine Event  
London, United Kingdom

March 9, 2012

Cell culture technology: recent advances, future prospects  
Welwyn Garden City,  
United Kingdom

March 23, 2012

Mycobacterium tuberculosis.....can we beat it?  
London, United Kingdom

March 27-31, 2012

2012 American College of Medical Genetics Annual Clinical Genetics Meeting  
Charlotte, North Carolina,  
CA, United States

March 29, 2012

Regulatory Cells in Autoimmunity event: Analysing and moderating function  
London, United Kingdom

March 30, 2012

Histopathology: Advances in research and techniques  
London, United Kingdom

April 15-24, 2012

Exome Sequencing  
Hinxtton,  
Cambridge, United Kingdom

April 19, 2012

Strategies for commercial success of biosimilars  
London, United Kingdom

May 11-12, 2012

4th International Course on Fluorescence in situ Hybridization  
Jena, Germany

May 17, 2012

Biomarker discovery: Driving technologies  
London, United Kingdom

May 23, 2012

Taking the heat out of chaperokine function  
London, United Kingdom

May 30 - June 1, 2012

Capita Selecta in Complex Disease

Analysis - CSCDA2012

Liège, Belgium

June 11-13, 2012

ICHG 2012: International Conference on Human Genetics  
Copenhagen, Denmark

June 13-22, 2012

Functional Genomics and Systems Biology  
Wellcome Trust Genome Campus,  
Hinxtton,  
Cambridge, United Kingdom

June 21-23, 2012

Satellite Meeting: The Biological Future of Man. Continuities and Break in the History of Human Genetics before and after 1945  
Nürnberg, Germany

June 23-26, 2012

European Human Genetics Conference 2012  
Nürnberg, Germany

July 1-4, 2012

28th Annual Meeting - ESHRE 2012  
Istanbul, Turkey

July 22-25, 2012

Human Genetics Society of Australasia 36th Annual Scientific Meeting  
Canberra, Australia

November 6-10, 2012

Annual Meeting of the American Society of Human Genetics  
San Francisco,  
CA, United States

December 5-8, 2012

10th Asia-Pacific Conference on Human Genetics 2012  
Kuala Lumpur, Malaysia

**GENERAL INFORMATION**

*World Journal of Medical Genetics* (*World J Med Genet*, *WJMG*, online ISSN 2220-3184, DOI: 10.5496) is a bimonthly peer-reviewed, online, open-access (OA), journal supported by an editorial board consisting of 103 experts in medical genetics from 28 countries.

The biggest advantage of the OA model is that it provides free, full-text articles in PDF and other formats for experts and the public without registration, which eliminates the obstacle that traditional journals possess and usually delays the speed of the propagation and communication of scientific research results. The open access model has been proven to be a true approach that may achieve the ultimate goal of the journals, i.e. the maximization of the value to the readers, authors and society.

**Maximization of personal benefits**

The role of academic journals is to exhibit the scientific levels of a country, a university, a center, a department, and even a scientist, and build an important bridge for communication between scientists and the public. As we all know, the significance of the publication of scientific articles lies not only in disseminating and communicating innovative scientific achievements and academic views, as well as promoting the application of scientific achievements, but also in formally recognizing the "priority" and "copyright" of innovative achievements published, as well as evaluating research performance and academic levels. So, to realize these desired attributes of *WJMG* and create a well-recognized journal, the following four types of personal benefits should be maximized. The maximization of personal benefits refers to the pursuit of the maximum personal benefits in a well-considered optimal manner without violation of the laws, ethical rules and the benefits of others. (1) Maximization of the benefits of editorial board members: The primary task of editorial board members is to give a peer review of an unpublished scientific article via online office system to evaluate its innovativeness, scientific and practical values and determine whether it should be published or not. During peer review, editorial board members can also obtain cutting-edge information in that field at first hand. As leaders in their field, they have priority to be invited to write articles and publish commentary articles. We will put peer reviewers' names and affiliations along with the article they reviewed in the journal to acknowledge their contribution; (2) Maximization of the benefits of authors: Since *WJMG* is an OA journal, readers around the world can immediately download and read, free of charge, high-quality, peer-reviewed articles from *WJMG* official website, thereby realizing the goals and significance of the communication between authors and peers as well as public reading; (3) Maximization of the benefits of readers: Readers can read or use, free of charge, high-quality peer-reviewed articles without any limits, and cite the arguments, viewpoints, concepts, theories, methods, results, conclusion or facts and data of pertinent literature so as to validate the innovativeness, scientific and practical values of their own research achievements, thus ensuring that their articles have novel arguments or viewpoints, solid evidence and correct conclusion; and (4) Maximization of the benefits of employees: It is an iron law that a first-class journal is unable to exist without first-class editors, and only first-class editors can create a first-class academic journal. We insist on strengthening our team cultivation and construction so that every employee, in an open, fair and transparent environment, could contribute their wisdom to edit and publish high-quality articles,

thereby realizing the maximization of the personal benefits of editorial board members, authors and readers, and yielding the greatest social and economic benefits.

**Aims and scope**

*WJMG* aims to rapidly report the most recent results in medical diagnostics, therapeutic techniques and equipment, clinical medical research, clinical and experimental techniques and methodology. Its purpose is to provide a platform to facilitate the integration of clinical and laboratory disciplines to highlight genotype-phenotype associations at a qualitative high level, which will help to improve diagnostic accuracy and medical care, and in the longer run, therapeutic intervention. The journal publishes original articles and reviews on the following topics: (1) Laboratory research, including but not limited to techniques in DNA/RNA sequencing, whole-genome linkage analyses and association studies, copy number variation profiling, epigenetic modifications in health and disease, elucidation of molecular and cellular pathways affected by gene mutations, determination of transcription factor binding sites, protein-protein interactions, preparation and transformation of induced pluripotent stem cells, animal models of human hereditary disorders and bioinformatics; and (2) Clinical genetics research on etiology, epidemiology, pathogenesis, morphology and function, signs and symptoms.

**Columns**

The columns in the issues of *WJMG* will include: (1) Editorial: To introduce and comment on the substantial advance and its importance in the fast-developing areas; (2) Frontier: To review the most representative achievements and comment on the current research status in the important fields, and propose directions for the future research; (3) Topic Highlight: This column consists of three formats, including (A) 10 invited review articles on a hot topic, (B) a commentary on common issues of this hot topic, and (C) a commentary on the 10 individual articles; (4) Observation: To update the development of old and new questions, highlight unsolved problems, and provide strategies on how to solve the questions; (5) Guidelines for Clinical Practice: To provide guidelines for clinical diagnosis and treatment; (6) Review: To systemically review the most representative progress and unsolved problems in the major scientific disciplines, comment on the current research status, and make suggestions on the future work; (7) Original Articles: To originally report the innovative and valuable findings in medical genetics; (8) Brief Articles: To briefly report the novel and innovative findings in medical genetics; (9) Case Report: To report a rare or typical case; (10) Letters to the Editor: To discuss and make reply to the contributions published in *WJMG*, or to introduce and comment on a controversial issue of general interest; (11) Book Reviews: To introduce and comment on quality monographs of medical genetics; and (12) Guidelines: To introduce consensus and guidelines reached by international and national academic authorities worldwide on the research in medical genetics.

## SPECIAL STATEMENT

All articles published in this journal represent the viewpoints of the authors except where indicated otherwise.

### Biostatistical editing

Statistical review is performed after peer review. We invite an expert in Biomedical Statistics from to evaluate the statistical method used in the paper, including *t*-test (group or paired comparisons), chi-squared test, Ridit, probit, logit, regression (linear, curvilinear, or stepwise), correlation, analysis of variance, analysis of covariance, *etc.* The reviewing points include: (1) Statistical methods should be described when they are used to verify the results; (2) Whether the statistical techniques are suitable or correct; (3) Only homogeneous data can be averaged. Standard deviations are preferred to standard errors. Give the number of observations and subjects (*n*). Losses in observations, such as drop-outs from the study should be reported; (4) Values such as ED50, LD50, IC50 should have their 95% confidence limits calculated and compared by weighted probit analysis (Bliss and Finney); and (5) The word 'significantly' should be replaced by its synonyms (if it indicates extent) or the *P* value (if it indicates statistical significance).

### Conflict-of-interest statement

In the interests of transparency and to help reviewers assess any potential bias, *WJMG* requires authors of all papers to declare any competing commercial, personal, political, intellectual, or religious interests in relation to the submitted work. Referees are also asked to indicate any potential conflict they might have reviewing a particular paper. Before submitting, authors are suggested to read "Uniform Requirements for Manuscripts Submitted to Biomedical Journals: Ethical Considerations in the Conduct and Reporting of Research: Conflicts of Interest" from International Committee of Medical Journal Editors (ICMJE), which is available at: [http://www.icmje.org/ethical\\_4conflicts.html](http://www.icmje.org/ethical_4conflicts.html).

Sample wording: [Name of individual] has received fees for serving as a speaker, a consultant and an advisory board member for [names of organizations], and has received research funding from [names of organization]. [Name of individual] is an employee of [name of organization]. [Name of individual] owns stocks and shares in [name of organization]. [Name of individual] owns patent [patent identification and brief description].

### Statement of informed consent

Manuscripts should contain a statement to the effect that all human studies have been reviewed by the appropriate ethics committee or it should be stated clearly in the text that all persons gave their informed consent prior to their inclusion in the study. Details that might disclose the identity of the subjects under study should be omitted. Authors

should also draw attention to the Code of Ethics of the World Medical Association (Declaration of Helsinki, 1964, as revised in 2004).

### Statement of human and animal rights

When reporting the results from experiments, authors should follow the highest standards and the trial should conform to Good Clinical Practice (for example, US Food and Drug Administration Good Clinical Practice in FDA-Regulated Clinical Trials; UK Medicines Research Council Guidelines for Good Clinical Practice in Clinical Trials) and/or the World Medical Association Declaration of Helsinki. Generally, we suggest authors follow the lead investigator's national standard. If doubt exists whether the research was conducted in accordance with the above standards, the authors must explain the rationale for their approach and demonstrate that the institutional review body explicitly approved the doubtful aspects of the study.

Before submitting, authors should make their study approved by the relevant research ethics committee or institutional review board. If human participants were involved, manuscripts must be accompanied by a statement that the experiments were undertaken with the understanding and appropriate informed consent of each. Any personal item or information will not be published without explicit consents from the involved patients. If experimental animals were used, the materials and methods (experimental procedures) section must clearly indicate that appropriate measures were taken to minimize pain or discomfort, and details of animal care should be provided.

---

## SUBMISSION OF MANUSCRIPTS

Manuscripts should be typed in 1.5 line spacing and 12 pt. Book Antiqua with ample margins. Number all pages consecutively, and start each of the following sections on a new page: Title Page, Abstract, Introduction, Materials and Methods, Results, Discussion, Acknowledgements, References, Tables, Figures, and Figure Legends. Neither the editors nor the publisher are responsible for the opinions expressed by contributors. Manuscripts formally accepted for publication become the permanent property of Baishideng Publishing Group Co., Limited, and may not be reproduced by any means, in whole or in part, without the written permission of both the authors and the publisher. We reserve the right to copy-edit and put onto our website accepted manuscripts. Authors should follow the relevant guidelines for the care and use of laboratory animals of their institution or national animal welfare committee. For the sake of transparency in regard to the performance and reporting of clinical trials, we endorse the policy of the ICMJE to refuse to publish papers on clinical trial results if the trial was not recorded in a publicly-accessible registry at its outset. The only register now available, to our knowledge, is <http://www.clinicaltrials.gov> sponsored by the United States National Library of Medicine and we encourage all potential contributors to register with it. However, in the case that other registers become available you will be duly notified. A letter of recommendation from each author's organization should be provided with the contributed article to ensure the privacy and secrecy of research is protected.

Authors should retain one copy of the text, tables, photographs and illustrations because rejected manuscripts will not be returned to the author(s) and the editors will not be responsible for loss or damage to photographs and illustrations sustained during mailing.

### Online submissions

Manuscripts should be submitted through the Online Submission System at: <http://www.wjgnet.com/esps/>. Authors are highly recommended to consult the ONLINE INSTRUCTIONS TO AUTHORS ([http://www.wjgnet.com/2220-3184/g\\_info\\_20100722180909.htm](http://www.wjgnet.com/2220-3184/g_info_20100722180909.htm)) before attempting to submit online. For assistance, authors encountering problems with the Online Submission System may send an email describing the problem to [wjmg@wjgnet.com](mailto:wjmg@wjgnet.com), or by telephone: +86-10-85381892. If you submit your manuscript online, do not make a postal contribution. Repeated online submission for the same manuscript is strictly prohibited.

## MANUSCRIPT PREPARATION

All contributions should be written in English. All articles must be submitted using word-processing software. All submissions must be typed in 1.5 line spacing and 12 pt. Book Antiqua with ample margins. Style should conform to our house format. Required information for each of the manuscript sections is as follows:

### Title page

**Title:** Title should be less than 12 words.

**Running title:** A short running title of less than 6 words should be provided.

**Authorship:** Authorship credit should be in accordance with the standard proposed by ICMJE, based on (1) substantial contributions to conception and design, acquisition of data, or analysis and interpretation of data; (2) drafting the article or revising it critically for important intellectual content; and (3) final approval of the version to be published. Authors should meet conditions 1, 2, and 3.

**Institution:** Author names should be given first, then the complete name of institution, city, province and postcode. For example, Xu-Chen Zhang, Li-Xin Mei, Department of Pathology, Chengde Medical College, Chengde 067000, Hebei Province, China. One author may be represented from two institutions, for example, George Sgourakis, Department of General, Visceral, and Transplantation Surgery, Essen 45122, Germany; George Sgourakis, 2nd Surgical Department, Korgialenio-Benakio Red Cross Hospital, Athens 15451, Greece

**Author contributions:** The format of this section should be: Author contributions: Wang CL and Liang L contributed equally to this work; Wang CL, Liang L, Fu JF, Zou CC, Hong F and Wu XM designed the research; Wang CL, Zou CC, Hong F and Wu XM performed the research; Xue JZ and Lu JR contributed new reagents/analytic tools; Wang CL, Liang L and Fu JF analyzed the data; and Wang CL, Liang L and Fu JF wrote the paper.

**Supportive foundations:** The complete name and number of supportive foundations should be provided, e.g. Supported by National Natural Science Foundation of China, No. 30224801

**Correspondence to:** Only one corresponding address should be provided. Author names should be given first, then author title, affiliation, the complete name of institution, city, postcode, province, country, and email. All the letters in the email should be in lower case. A space interval should be inserted between country name and email address. For example, Montgomery Bissell, MD, Professor of Medicine, Chief, Liver Center, Gastroenterology Division, University of California, Box 0538, San Francisco, CA 94143, United States. montgomerybissell@ucsf.edu

**Telephone and fax:** Telephone and fax should consist of +, country number, district number and telephone or fax number, e.g. Telephone: +86-10-85381892 Fax: +86-10-85381893

**Peer reviewers:** All articles received are subject to peer review. Normally, three experts are invited for each article. Decision for acceptance is made only when at least two experts recommend an article for publication. Reviewers for accepted manuscripts are acknowledged in each manuscript, and reviewers of articles which were not accepted will be acknowledged at the end of each issue. To ensure the quality of the articles published in *WJMG*, reviewers of accepted manuscripts will be announced by publishing the name, title/position and institution of the reviewer in the footnote accompanying the printed article. For example, reviewers: Professor Jing-Yuan Fang, Shanghai Institute of Digestive Disease, Shanghai, Affiliated Renji Hospital, Medical Faculty, Shanghai Jiaotong University, Shanghai, China; Professor Xin-Wei Han, Department of Radiology, The First Affiliated Hospital, Zhengzhou University, Zhengzhou, Henan Province, China; and Professor Anren Kuang,

Department of Nuclear Medicine, Huaxi Hospital, Sichuan University, Chengdu, Sichuan Province, China.

### Abstract

There are unstructured abstracts (no more than 256 words) and structured abstracts (no more than 480). The specific requirements for structured abstracts are as follows:

An informative, structured abstracts of no more than 480 words should accompany each manuscript. Abstracts for original contributions should be structured into the following sections. AIM (no more than 20 words): Only the purpose should be included. Please write the aim as the form of "To investigate/study/...; MATERIALS AND METHODS (no more than 140 words); RESULTS (no more than 294 words): You should present *P* values where appropriate and must provide relevant data to illustrate how they were obtained, e.g.  $6.92 \pm 3.86$  vs  $3.61 \pm 1.67$ ,  $P < 0.001$ ; CONCLUSION (no more than 26 words).

### Key words

Please list 5-10 key words, selected mainly from *Index Medicus*, which reflect the content of the study.

### Text

For articles of these sections, original articles and brief articles, the main text should be structured into the following sections: INTRODUCTION, MATERIALS AND METHODS, RESULTS and DISCUSSION, and should include appropriate Figures and Tables. Data should be presented in the main text or in Figures and Tables, but not in both. The main text format of these sections, editorial, topic highlight, case report, letters to the editors, can be found at: [http://www.wjgnet.com/2220-3184/g\\_info\\_20100725072755.htm](http://www.wjgnet.com/2220-3184/g_info_20100725072755.htm).

### Illustrations

Figures should be numbered as 1, 2, 3, *etc.*, and mentioned clearly in the main text. Provide a brief title for each figure on a separate page. Detailed legends should not be provided under the figures. This part should be added into the text where the figures are applicable. Figures should be either Photoshop or Illustrator files (in tiff, eps, jpeg formats) at high-resolution. Examples can be found at: <http://www.wjgnet.com/1007-9327/13/4520.pdf>; <http://www.wjgnet.com/1007-9327/13/4554.pdf>; <http://www.wjgnet.com/1007-9327/13/4891.pdf>; <http://www.wjgnet.com/1007-9327/13/4986.pdf>; <http://www.wjgnet.com/1007-9327/13/4498.pdf>. Keeping all elements compiled is necessary in line-art image. Scale bars should be used rather than magnification factors, with the length of the bar defined in the legend rather than on the bar itself. File names should identify the figure and panel. Avoid layering type directly over shaded or textured areas. Please use uniform legends for the same subjects. For example: Figure 1 Pathological changes in atrophic gastritis after treatment. A: ...; B: ...; C: ...; D: ...; E: ...; F: ...; G: ...*etc.* It is our principle to publish high resolution-figures for the printed and E-versions.

### Tables

Three-line tables should be numbered 1, 2, 3, *etc.*, and mentioned clearly in the main text. Provide a brief title for each table. Detailed legends should not be included under tables, but rather added into the text where applicable. The information should complement, but not duplicate the text. Use one horizontal line under the title, a second under column heads, and a third below the Table, above any footnotes. Vertical and italic lines should be omitted.

### Notes in tables and illustrations

Data that are not statistically significant should not be noted. <sup>a</sup> $P < 0.05$ , <sup>b</sup> $P < 0.01$  should be noted ( $P > 0.05$  should not be noted). If there are other series of *P* values, <sup>c</sup> $P < 0.05$  and <sup>d</sup> $P < 0.01$  are used. A third series of *P* values can be expressed as <sup>e</sup> $P < 0.05$  and <sup>f</sup> $P < 0.01$ . Other notes in tables or under illustrations should be expressed as <sup>1</sup>F, <sup>2</sup>F, <sup>3</sup>F; or sometimes as other symbols with a superscript (Arabic numerals) in the upper left corner. In a multi-curve illustration, each curve should be labeled with ●, ○, ■, □, ▲, △, *etc.*, in a certain sequence.

### Acknowledgments

Brief acknowledgments of persons who have made genuine contributions to the manuscript and who endorse the data and conclusions should be included. Authors are responsible for obtaining written permission to use any copyrighted text and/or illustrations.

## REFERENCES

### Coding system

The author should number the references in Arabic numerals according to the citation order in the text. Put reference numbers in square brackets in superscript at the end of citation content or after the cited author's name. For citation content which is part of the narration, the coding number and square brackets should be typeset normally. For example, "Crohn's disease (CD) is associated with increased intestinal permeability<sup>[1,2]</sup>". If references are cited directly in the text, they should be put together within the text, for example, "From references<sup>[19,22-24]</sup>, we know that..."

When the authors write the references, please ensure that the order in text is the same as in the references section, and also ensure the spelling accuracy of the first author's name. Do not list the same citation twice.

### PMID and DOI

Please provide PubMed citation numbers to the reference list, e.g. PMID and DOI, which can be found at <http://www.ncbi.nlm.nih.gov/sites/entrez?db=pubmed> and <http://www.crossref.org/SimpleTextQuery/>, respectively. The numbers will be used in E-version of this journal.

### Style for journal references

Authors: the name of the first author should be typed in bold-faced letters. The family name of all authors should be typed with the initial letter capitalized, followed by their abbreviated first and middle initials. (For example, Lian-Sheng Ma is abbreviated as Ma LS, Bo-Rong Pan as Pan BR). The title of the cited article and italicized journal title (journal title should be in its abbreviated form as shown in PubMed), publication date, volume number (in black), start page, and end page [PMID: 11819634 DOI: 10.3748/wjg.13.5396].

### Style for book references

Authors: the name of the first author should be typed in bold-faced letters. The surname of all authors should be typed with the initial letter capitalized, followed by their abbreviated middle and first initials. (For example, Lian-Sheng Ma is abbreviated as Ma LS, Bo-Rong Pan as Pan BR) Book title. Publication number. Publication place: Publication press, Year: start page and end page.

### Statistical data

Write as mean  $\pm$  SD or mean  $\pm$  SE.

### Statistical expression

Express *t* test as *t* (in italics), *F* test as *F* (in italics), chi square test as  $\chi^2$  (in Greek), related coefficient as *r* (in italics), degree of freedom as *v* (in Greek), sample number as *n* (in italics), and probability as *P* (in italics).

### Units

Use SI units. For example: body mass, *m* (B) = 78 kg; blood pres-

sure,  $p$  (B) = 16.2/12.3 kPa; incubation time,  $t$  (incubation) = 96 h, blood glucose concentration,  $c$  (glucose)  $6.4 \pm 2.1$  mmol/L; blood CEA mass concentration,  $p$  (CEA) = 8.6 24.5  $\mu\text{g/L}$ ;  $\text{CO}_2$  volume fraction, 50 mL/L  $\text{CO}_2$ , not 5%  $\text{CO}_2$ ; likewise for 40 g/L formaldehyde, not 10% formalin; and mass fraction, 8 ng/g, *etc.* Arabic numerals such as 23, 243, 641 should be read 23 243 641.

The format for how to accurately write common units and quantum numbers can be found at: [http://www.wjgnet.com/2220-3184/g\\_info\\_20100725073806.htm](http://www.wjgnet.com/2220-3184/g_info_20100725073806.htm).

### Abbreviations

Standard abbreviations should be defined in the abstract and on first mention in the text. In general, terms should not be abbreviated unless they are used repeatedly and the abbreviation is helpful to the reader. Permissible abbreviations are listed in Units, Symbols and Abbreviations: A Guide for Biological and Medical Editors and Authors (Ed. Baron DN, 1988) published by The Royal Society of Medicine, London. Certain commonly used abbreviations, such as DNA, RNA, HIV, LD50, PCR, HBV, ECG, WBC, RBC, CT, ESR, CSF, IgG, ELISA, PBS, ATP, EDTA, mAb, can be used directly without further explanation.

### Italics

Quantities:  $t$  time or temperature,  $c$  concentration,  $A$  area,  $l$  length,  $m$  mass,  $V$  volume.

Genotypes: *gyrA*, *arg 1*, *c myc*, *c fos*, *etc.*

Restriction enzymes: *EcoRI*, *HindI*, *BamHI*, *Kho I*, *Kpn I*, *etc.*

Biology: *H. pylori*, *E. coli*, *etc.*

## SUBMISSION OF THE REVISED MANUSCRIPTS AFTER ACCEPTED

Please revise your article according to the revision policies of *WJMG*. The revised version including manuscript and high-resolution image figures (if any) should be re-submitted online (<http://www.wjgnet.com/2220-3184office/>). The author should send the copyright transfer letter, responses to the reviewers, English language Grade B certificate (for non-native speakers of English) and final manuscript checklist to [wjmg@wjgnet.com](mailto:wjmg@wjgnet.com).

### Language evaluation

The language of a manuscript will be graded before it is sent for revision. (1) Grade A: priority publishing; (2) Grade B: minor language polishing; (3) Grade C: a great deal of language polishing needed; and (4) Grade D: rejected. Revised articles should reach Grade A or B.

### Copyright assignment form

Please download a Copyright assignment form from [http://www.wjgnet.com/2220-3184/g\\_info\\_20100725073726.htm](http://www.wjgnet.com/2220-3184/g_info_20100725073726.htm).

### Responses to reviewers

Please revise your article according to the comments/suggestions provided by the reviewers. The format for responses to the reviewers' comments can be found at: [http://www.wjgnet.com/2220-3184/g\\_info\\_20100725073445.htm](http://www.wjgnet.com/2220-3184/g_info_20100725073445.htm).

### Proof of financial support

For paper supported by a foundation, authors should provide a copy of the document and serial number of the foundation.

### Links to documents related to the manuscript

*WJMG* will be initiating a platform to promote dynamic interactions between the editors, peer reviewers, readers and authors. After a manuscript is published online, links to the PDF version of the submitted manuscript, the peer-reviewers' report and the revised manuscript will be put on-line. Readers can make comments on the peer reviewer's report, authors' responses to peer reviewers, and the revised manuscript. We hope that authors will benefit from this feedback and be able to revise the manuscript accordingly in a timely manner.

### Science news releases

Authors of accepted manuscripts are suggested to write a science news item to promote their articles. The news will be released rapidly at EurekAlert/AAAS (<http://www.eurekalert.org>). The title for news items should be less than 90 characters; the summary should be less than 75 words; and main body less than 500 words. Science news items should be lawful, ethical, and strictly based on your original content with an attractive title and interesting pictures.

### Publication fee

*WJMG* is an international, peer-reviewed, OA, online journal. Articles published by this journal are distributed under the terms of the Creative Commons Attribution Non-commercial License, which permits use, distribution, and reproduction in any medium, provided the original work is properly cited, the use is non commercial and is otherwise in compliance with the license. Authors of accepted articles must pay a publication fee. Publication fee: 600 USD per article. Editorial, topic highlights, book reviews and letters to the editor are published free of charge.
